dotConnect for SQLite Standard is a practical and effective data provider especially designed for SQLite, being able to build database applications with ease. Mostly intended for developers and database administrators, this ORM - enabled data provider introduces new approaches for designing such apps. Since it is compatible with the latest versions of SQLite, Microsoft Visual Studio, SQL Server 2008 Business Intelligence Solutions and even Embarcadero Delphi Prism, dotConnect for SQLite Standard provides you with complete editors in order to simplify component tweaking. Developed with wide adaptability in mind, you can use this component in WinForms and ASP.NET applications effortlessly. This way, you can make use of the entire capabilities of the SQLite engine, thus improving and optimizing your development process. As far as the ORM (Object-relational mapping) solutions are concerned, dotConnect for SQLite Standard comes bundled with intuitive and practical ORM models, here

referring to ADO.NET Entity Framework, NHibernate, and LinqConnect that also support SQL Server, Oracle, MySQL and PostgreSQL. On this manner, you are able to automate specific tasks such as generating SQL scripts for loading and saving objects, executing DML (Data Manipulation Language) statements in batches, and simplifying data - object conversion. Another advantage of the component is that it includes various features that help you in the development of database programs such as provider factories, connection string builders, metadata schemas and asynchronous commands, to name a few. Considering the classes that will become available after the component is properly configured, you can easily expose and read a forward-only stream of data and execute SQL statements from SQLite databases, execute different queries and monitor dynamic SQL executions. To wrap it up, dotConnect for SQLite Standard is a steady and effective ORM component that comes packed with useful features and classes worth having when you need to build and design database applications. dotConnect for SQLite Standard

Screenshot: Enterprise ready, stand-alone SQLite data provider for.NET. SQLite Data Provider for.NET is a SQLite database driver for.NET. This.NET Database provider is based on the SQLite version 3.7.11 and supports SQLite Standard and SQLite Compact Editions. SQLite Data Provider for.NET does not require any runtime DLLs and it also does not require the Microsoft.Data.SQLite.dll assembly. SQLite data provider is a SQLite database driver for.NET. SQL

DotConnect For SQLite Standard Free Download (Latest)

- * Asynchronously executes sqlite commands in memory *
- Copies sqlite commands to a temporary file (sqlite_command_file) and reads it into memory *
- Supports pre-populating databases with data from files, blobs, streams, and text *
- Supports a number of unique features not available in the native SQLite.NET provider *
- Supports custom User Defined Type (UDT) creation and custom Entity Data Model (EDM) support (built using Table data model) *
- Supports

Table Data Model that allows you to create an EDM from a database * Allows you to provide alternate access paths for a table (denormalized mode) * Supports Table Data Model that allows you to create an EDM from a database and denormalizes it by table in memory * SQLite3.dll is bundled and will be used in the background by dotConnect for SQLite Standard Cracked Accounts * Supports custom SQLite extensions and custom SQLite properties * Supports SQL Express edition (Microsoft has removed Express edition from SQL Server 2008) * Supports SQL Server 2008 Business Intelligence Solutions (the SQL Server CE version is not included) * Supports SQL Server 2008 R2 Business Intelligence Solutions (including SQL Server Compact Edition, the SQL Server CE version is not included) * Supports SQL Server 2008 (in Memory mode only, the SQL Server CE version is not included) * Supports SQL Server 2008 R2 (in Memory mode only, the SQL Server CE version is not included) * Supports SQL Server 2008 (in Memory mode only, the SQL Server CE version is not included) * Supports

SQL Server 2008 R2 (in Memory mode only, the SQL Server CE version is not included) * Supports MySQL 5.1 or 5.2 (In Memory mode only, the SQL Server CE version is not included) * Supports Oracle 10g or 11g (In Memory mode only, the SQL Server CE version is not included) * Supports PostgreSQL 7.4 (In Memory mode only, the SQL Server CE version is not included) * Supports SQL Server 7.0 (In Memory mode only, the SQL Server CE version is not included) * Supports SQL Server 2005 (In Memory mode only, the SQL Server CE version is not included) * Supports Microsoft Excel 2007 (x86 and x64) * Supports Microsoft Access 2003 (x86 and x64) * Supports SQL Server 2005 (in Memory mode only, the SQL Server CE version is not included) 77a5ca646e

Use this component for building database applications with SQLite. It includes a command-line SQLite driver, a set of generic components, entity providers, mapping components and a command line SQLite editor that you can use to edit your SQLite statements before you execute them. Also you can use it to read and write objects to SQLite databases.

dotConnect for SQLite Standard Features: As far as the ORM (Object relational mapping) solutions are concerned, dotConnect for SQLite Standard comes bundled with intuitive and practical ORM models, here referring to ADO.NET Entity Framework, NHibernate, and LinqConnect that also support SQL Server, Oracle, MySQL and PostgreSQL. On this manner, you can automate specific tasks such as generating SQL scripts for loading and saving objects, executing DML (Data Manipulation Language) statements in batches, and simplifying data - object conversion. Also it includes provider factories, connection string builders, metadata schemas and

asynchronous commands, among other features. dotConnect for SQLite Standard Requirements: 2. Latest version of SQLite and the Microsoft Visual Studio 2010 or above are required 3. Latest version of Microsoft Visual Studio 2008 is required 4. dotConnect for SQLite Standard Notes: 1. Create Connection. The connection string is a string, in the form of a colon separated list of parameters, that represents the name of the database and the hostname, port, and user name, user password, and database name to connect to that database. 2. Generate Connection String. This can be done by selecting Tools, Options, Database Engine, Options. If an option named 'Connection string' is found, double click it to open the Edit Connection String dialog. 3. Connect to database. Click Browse and select the drive on which the database resides, then enter the path in the Source text box, and click OK. 4. Add Command to Database. Select the menu, and click Execute to execute the stored procedure. 5. Create Connection. The connection string is a string, in the form of a colon separated list of parameters, that represents the name of

the database and the hostname, port, and user name, user password, and database name to connect to that database. 6. Generate Connection String. This can be done by selecting Tools, Options, Database Engine, Options. If an option named

dotConnect for SQLite Standard Download: To get this component you can download it from its website at www.dotconnectforsqlite.com. You can also find this component in both 32 and 64 bit editions.

Iso Media Extractor is a versatile, easy-to-use, advanced multipurpose data extractor, which supports data extraction from more than 250 compressed and encrypted formats as well as a number of multimedia files including MP3, OGG, MOV, DVD, MPEG, VOB, and others. You can set the following properties to extract any type of data from the source: Name and location of target file, time-stamp of the target file, file-type, file size, date, artist name, album name, genre name, and other properties.

Key features: Extract any type of data from the source, including:

- Artist names, album names, and song titles

-
- Album art and metadata (e.g., artist name, date of recording,
